

AgentLens

TIKTOK TECHJAM 2026 / AGENT LAUNCHPAD

From agent execution to inspectable evidence

Middleware focus: trace, audit and observability. Existing platform and runtime retained.

RUNTIME PROFILES / DO NOT CONFUSE LOGICAL AND PHYSICAL BOUNDARIES

Local POC - independent Runtime

Host API launches one disposable container per turn. Workspace bind mount, configured UID, dropped capabilities, and CPU / memory / PID limits. Landlock is probed; any fallback is inside that container, not on the host.

Windows Compose - shared application container

API and Codex processes share one container; runtime=local-process. No independent per-Agent container boundary. Shared state and credentials must not be treated as protected from a hostile Agent in this profile.

Recovery Restart reconciles active Runs; terminal steps close; legacy identity backfills record provenance.

* Redaction applies to trace/audit payloads, not every stored chat or workspace file. Unknown secrets can escape detection.

Single-user POC. Policy is observational, not pre-execution approval. Health and auth-discovery routes remain public.

Source: gaoze24/agentlens + reviewed audit fixes (4aa5e7b). Baseline: RrankPyramid/CodeJam.
